Kookong红外SDK使用文档

酷控SDK资料由SDK工程和debug.keystore组成:

- 1.在Eclipse中导入酷控提供的Sample工程
- 2.替换您Eclipse中的debug.keystore为酷控提供的keystore,这时候您就可以成功运行酷控SDK的Sample工程了

3.为了保护数据, 酷控SDK绑定了App的签名和包名, 厂商需要向酷控申请Appkey以达到使用SDK各项功能的目的. 和酷控达成合作之后, 请咨询我获取Appkey

测试的AppKey在压缩包中

在Sample项目的MainActivity中更改SDK的AppKey:

```
public class MainActivity extends Activity implements OnClickListener

public static final String APP_KEY = "4E70159C5A3533C842ECFEED65333DB9";

@Override
protected void ontroot (Bundle savedInstanceState) {
    super.onCreate(savedInstanceState);
    setContentView(R.layout.activity_main);
    //1.在App的入口进行初始化,在Application中初始化也可以
    boolean result = KookongSDK.init(Hong);
    logUtil d("Venify perult is " + perult);
```

4.SDK的主要功能和调用参数在MainActivity中有注释.

例如获取红外码数据:

```
case R.id.setupflow_get_remotedata:

//获取rid = 4162 和 10687的紅外码,批單获取紅外码的方式是逗号隔开

KookongSDK.getIRDataById("4162,10687", new IRequestResult<IrDataList>()

@Override

public void onSuccess(String msg, IrDataList result) {

    List<IrData> irDatas = result.getIrDataList();

    for (int i = 0; i < irDatas.size(); i++) {

        Logger.d("The rid is " + irDatas.get(i).rid);

    }

}

@Override

public void onFail(String msg) {

    TipsUtil.toast(MainActivity.this, msg);

}

});

heark:
```

注意:AndroidStudio请自行导入,可能需要修复Gradle编译过程中出现的问题 Sample工程访问云端并不稳定,如有拿不到数据的情况,请联系我
